Model-based methods

- Reconstruct the geometry and appearance explicitly.
- Support re-rendering naturally
- Inaccuracy due to practical and model limitations

Nam et al. 2018

Kang et al. 2019

Image-based methods

- Directly leverage the information embedded in input images.
- Generate photorealistic results without explicit modeling
- Rely on dense and complicated setup
- Major image-based methods do not support relighting.

Thies et al. 2019

Xu et al. 2019

360° Free-viewpoint relighting

- Double hand-held devices
- Both cameras are in video mode.
 - One of them with its co-located flash light turned on.
 - DSLR camera or mobile phone camera.

Conclusion & Future work

- A novel deferred neural lighting solution
 - Enables full 360° free-viewpoint relighting from unstructured photographs.
 - Suitable for scenes captured with a novel dual handheld mobile camera setup.
 - Supports a wide range of lighting conditions.
- Future Work
 - Explore other methods for reducing the number of required photographs.

ACKNOWLEDGEMENTS

- Anonymous reviewers
- Nam et al. [2018] for helping the comparison
- Xu et al. [2018] for sharing the trained model
- NSF grant IIS-1909028
- National Natural Science Foundation of China

Thanks
